Hereditary pancreatitis HP is an inflammation of the pancreas attributed to genetic causes. Classic HCP seems to follow an autosomal dominant inheritance with incomplete penetrance and highly variable disease expression. More importantly, the model fails to explain how the other pancreatitis associated PRSS1 mutations might work, as the majority of these do not affect trypsin stability. Thetubegoesdownintothesmallintestinetotakeapictureofthepancreas. Hereditary pancreatitis is rare and primarily a disease of Caucasians. In the United States, it is estimated that at least 1, individuals are affected with hereditary pancreatitis. DigDis191–PitchumoniCS. The degradation of trypsin is a complex and well-orchestrated process involving both an additional trypsin molecule and CTFC. Namespaces Article Talk.
